## AutoCAD Crack License Key PC/Windows (Updated 2022)

Role of brain nitric oxide, NO synthase and GABAergic system in attenuating seizure-like behaviours. Nitric oxide (NO) and  $\gamma$ -aminobutyric acid (GABA) have been shown to play a role in the modulation of seizure-like behaviours, but their interplay remains unexplored. This study investigated the role of NO and GABAergic system in the attenuation of pentylenetetrazol (PTZ)-induced seizure-like behaviour in rats. The effect of PTZ on NO and NO synthase (NOS) activity and the influence of a nitric oxide synthase inhibitor (NAME) on PTZ-induced seizure-like behaviours were assessed. To evaluate the GABAergic system, the effect of PTZ and bicuculline, a GABA(A) receptor antagonist, on the levels of nitric oxide metabolites (NO<sub>x</sub>) and the influence of a GABA(A) receptor agonist (muscimol) on PTZ-induced seizure-like behaviour were examined. PTZ (100 mg/kg, i.p.) induced seizure-like behaviours in the majority of the rats (67.5%). The seizure-like behaviour was preceded by a marked increase in NO<sub>x</sub> concentration. Pretreatment with NAME (50 mg/kg, i.p.) significantly attenuated the seizure-like behaviour (PDESCRIPTION (Applicant's Abstract): Anti-tumor necrosis factor (TNF) therapies are potentially beneficial in treating multiple sclerosis (MS) in a subset of patients. Many patients with relaps
