Completing the basic gameplay, its story, and the characters through dialogue is of course possible when playing the game. However, ELDEN: Rise of Tarnished Gods actually features a dedicated online experience in which you communicate through the system link, known as party chat, with other players who are online. The system is limited to only online play, so if you want to stay the same way you played single player, you must make sure that you don't have anything going on the same time. PRODUCT HIGHLIGHTS 1. A Long Online Play Time You can play this game all day online for free, because the online play part is not restricted to only a short time. 2. Unparalleled 3D Graphics The game has graphics that will be pleasant to watch for hours, and you can also enjoy playing it in 3D if you have 3D compatible devices. 3. Your own character can change appearance as you wish, and you can also create weapons or armor with multiple different specifications. 7. Original and Compelling Drama This is the story of fantasy, love, and the ending of an era, told in a series of fragmented flashbacks. It is also the story of how the universe was created, as well as a story about the birth of the World-Tree. 8. Unique Online Play Features You can enjoy a game with others by communicating with them directly using the in-game party chat. 9. Players can easily understand the basic game mechanics Components such as characters and world elements have been added so that the basic playability is kept at the simplest level possible. 10. **Semiconductor devices such as logic and memory devices are typically fabricated by a sequence of processing steps applied to a specimen. The various features and multiple structural levels of the semiconductor devices are formed by these processing steps. For example, lithography among others is one semiconductor fabrication process that involves forming a pattern on a semiconductor substrate. Additional examples of semiconductor fabrication processes include, but are not limited to, chemical-mechanical polishing, etch, deposition, and ion implantation. Multiple semiconductor devices may be fabricated on a single semiconductor wafer and then separated into individual semiconductor devices. Inspection processes are used at various steps during a semiconductor manufacturing process to detect defects on wafers to promote higher yield in the manufacturing process and thus higher profits. As design rules and process dimensions are reduced and semiconductor devices are more densely packaged, inspection processes have become important to the success of semiconductor manufacturing. For example, inspection processes are used to detect defects on wafers prior to performing bonding and packaging operations, and to analyze characteristics of the completed wafer or die. One such inspection system is a bright-field inspection system. Bright-field inspection systems illuminate the surface of the specimen with bright light and detect scattered light emitted from the specimen. Bright-field inspection systems may include an illumination system, which includes one or more illumination sources which illuminate a surface of the specimen. Any light not scattered by features of the surface of the specimen is scattered by structures**
