Freeware: FS2004 Captain Sim - How To Install FS2004 Captain Sim. Racial and ethnic variations in the experience of patients admitted for breast cancer. Racial and ethnic disparities in breast cancer incidence and outcomes are well documented. However, little is known about how racial/ethnic background influences the experience of patients with breast cancer. The purpose of this study was to examine differences in experience of care among black, white, and Hispanic women diagnosed with breast cancer. Data from the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) registry for the years 1988 to 1992 were analyzed. Hospitals were coded according to patient race/ethnicity at time of diagnosis (excluding Hispanic data) using the last office of record. The main outcome measure was the proportion of patients with complications of care. The 10 most common complications were compared across the three groups. The differences in complications according to ethnic group were assessed using Poisson regression. The study included 32,906 women. Of these, 29.5% were black, 26.7% were white, and 38.9% were Hispanic. The mean age at diagnosis was 58.6 years. Complications of care for all patients with breast cancer were similar to those in the general population of breast cancer patients. Black women were more likely than white women and Hispanic women to have complications of care (odds ratio [OR] = 2.7, 95% confidence interval [CI], 2.2-3.3; OR = 1.4, 95% CI, 1.2-1.6). Complications of care for Hispanic women were also more likely than white women, but there was no significant difference between Hispanic and black women (OR = 1.2, 95% CI, 0.8-1.8). Ethnic and racial differences in breast cancer care should be recognized, particularly in the area of medical complications. Hispanic patients should
