About Benjie My name is Benjie Tijssen, I am an IT consultant and IT blogger from Groningen, the Netherlands. I am a father of one boy and one girl. You are currently reading my personal blog which is a collection of software reviews, links to IT news and other posts and articles about Windows that I find interesting. Read more about Benjie...Q: How to share a resource between a Content Provider and an Activity without passing through the ContentResolver? Say I have an API class which communicates with the remote services and want to share some information among its clients. I want to have an activity which implements LocationListener on the background. When a LocationFinder object is passed in to the API, the object returns the location via setResult() and the activity finishes. When the API is done processing, it sends a message via AlarmManager saying Location is done. And the activity is called once the alarm expires which will then do postStatusUpdates(). Question: How does one share this result between the API class and the activity without using any ContentProviders? Worst-case scenario: API invokes a ContentProvider object

### **Whiist [Updated] 2022**

===== Whiist is a Free and Easy to use web content management system for Windows Home Server. Features: ===== \* Create and manage websites, photo albums and homepage links. \* Customizable software, web links, and text. \* Access content on any internet connected device. \* Personalize content with your own logo and custom CSS styling. \* Easily edit or delete any web page. \* Create your own portal page by extending and linking your WHiist sites. \* This version is only compatible with WHiist 3.0 Special needs: ===== This Add-In does not work with the more recent WHiist versions released since 2012.

---

After 2010 WHiist releases are only available as a Win32 application, not a X32 (x64) Add-In. For more information, see: How to install: ===== To run this program the WHiist Add-In must be installed first. For installation instructions, please see the Whiist Program Instructions link at the bottom of this page. After installation of the Whiist Add-In please run the Whiist Setup Wizard. It will ask you to click through a series of Windows prompts to upgrade your WHiist install. WHiist Setup Wizard Complete: This Add-In will be available in the WHiist Add-Ins window in the WHiist installation. If the "Website Management" tab does not show up, please clear your temporary Internet Files.

Supported Operating Systems:

===== This Add-In is compatible with Windows Home Server 7, 8, and 10 versions. Please contact support@whiist.org or the whiist forums for Windows Home Server Add-Ins compatible with Windows Home Server 2012 and later. Dependencies: ===== You must have WHiist 3.0 or later installed. This program is not compatible with WHiist 2.5 and earlier. Instructions: ===== Disclaimer: The WHiist website and the WHiist Add-In support software are intended to be used and tested under the conditions in which they will be used. As such the software and website are

You can also add links to your Home Server's homepage. Whiist supports reading and writing to multiple web files, user accounts, and scripts. For more information about Whiist, please refer to Overview

=====

Whiist adds a "Website Management" tab to your Home Server Console that allows you to create and manage new websites, photo albums, and homepage links. Whiist Description:

=====

Whiist is a simple tool that allows you to create and manage web content on your Windows Home Server. By using this tool, you will be able to create new websites and photo albums. You can also add links to your Home Server's homepage. Whiist supports reading and writing to multiple web files, user accounts, and scripts. For more information about Whiist, please refer to How to detect browser language or use given language in JavaScript file I am using.js file for a Joomla component that is working in any browser. I want to detect browser language and use certain language in my components's.js file. I tried using HTML: window.onload = function () { //Based on language detect browser lang or use given language. } The above code worked only when the language of the browser is English or Hebrew. But it does not work for other languages. Is there any other way to detect the browser language and if the browser language is not English or Hebrew use given language or use the default language. A: The Language Neutral JavaScript file includes /\* If you get a "you do not have permission... " js error in ie 8, use this expression to create a.js file with this code for ie 7 and 8 and
