Various systems or mechanisms for controlling the weight of a vehicle exist in the prior art. In manual systems, the system operator manually selects the appropriate amount of weight which is added or subtracted from the vehicle in order to increase or decrease the weight of the vehicle. In remote systems, a power unit controls the load-supporting mass of the vehicle. Generally, in prior art manual systems, the operator enters a requested weight for the vehicle into a console. The console then transmits a control signal to a manually operated cylinder-piston arrangement which is fluidly connected to the load-supporting mass of the vehicle such as the wheels, axles, springs, frame, cargo, passengers or other load-supporting members of the vehicle. As the cylinder-piston arrangement is manually compressed or extended, the load-supporting mass of the vehicle increases or decreases according to the amount of mass or weight of the vehicle desired by the operator.
