

RTD-ZOOM DL not working December 02, 2008 · I've tried all the hyperlinks without success. Archive.org is certainly doing something wrong! kokosz · Tags: dia mips rslatinos · This program is available from the three sites below for all current versions of the program, including SAP2000 v7.42 64 bit. I am trying to fix a core dump error in SAP2000 v7.42 64 bit... Best of all, you dont need to have.Q: Using the concatenation operator on two variables is wrong, and why? I'm in my first college course studying programming and I've just come across the multiple choice question that they've given us as a homework assignment. I've drawn a fair amount of attention from a friend of mine by asking him to correct the question as I believe it should be done. As you might have guessed by the title of this question, I want to know why it's wrong to use the concatenation operator between two variables, instead of simply using the + sign. Can anyone tell me if it's correct? The expression (int) (10-x) is a valid conversion expression (the type of which is int), and can be used to implicitly convert an object of type int to an object of type int. A: Can anyone tell me if it's correct? It is incorrect if what you mean is that the expression (int) (10 - x) is a valid conversion expression of an int to an int. The expression 10 - x first uses the built-in subtraction operator (the - operator) to perform the subtraction, and the result is an int. So now you have an int result and an int lhs which is a reference to an int which is on the left-hand side of the assignment statement, and you are assigning that result to that reference. There is some documentation of the type of the resulting reference but it is not accessible to you. You cannot use that reference as the lhs in a conversion statement (nor in an assignment statement), because you would be storing a converted int to a reference of type int; that is at best meaningless and at worst crashes the program. For an example of why this can go wrong, check this out: int i = 10; int k = 5;
